

shipgrade Report

Target: <https://github.com/qwertyuii7>

87 / 100 (Grade B)

🔥 Decent effort, but still rough around the edges. Did you skip coffee today?

Executive Summary: Top Fixes

ID: perf.blocking **Effort: MEDIUM**

1 render-blocking script(s) in <head>

💡 *How to fix:* Add 'defer' or 'async' to <script> tags in the head to avoid blocking page render.

ID: seo.h1 **Effort: LOW**

Found 2 H1 tags

💡 *How to fix:* While HTML5 allows multiple H1s, best practice for SEO is a single clear H1 per page.

ID: perf.ttfb **Effort: MEDIUM**

Moderate TTFB (764ms)

💡 *How to fix:* Consider caching or CDN to improve server response time.

ID: perf.html **Effort: LOW**

Large HTML document (237KB)

💡 *How to fix:* Consider reducing inline CSS/JS or simplifying DOM to speed up parsing.

ID: seo.sitemap **Effort: LOW**

sitemap.xml is missing

💡 *How to fix:* Add a sitemap.xml file and submit it to Google Search Console.

SEO (Score: 90%)

PASS seo.status

Message: Status 200 OK

Why it matters: If your main page doesn't return a 200 OK status, search engines will assume the page is broken and refuse to index it.

PASS seo.title

Message: Title tag is optimal

Why it matters: The title tag is the most critical on-page SEO factor. It's the large blue link in search results and directly impacts click-through rates.

PASS seo.description

Message: Meta description is optimal

Why it matters: The meta description acts as your organic ad copy in search results. A missing or poorly-sized description means search engines will auto-generate one, hurting your click-through rate.

WARN seo.h1

Message: Found 2 H1 tags

Why it matters: Search engines use the H1 tag to understand the primary topic of the page. Multiple H1s or a missing H1 dilutes that signal.

💡 **How to fix:** While HTML5 allows multiple H1s, best practice for SEO is a single clear H1 per page.

PASS seo.canonical

Message: Canonical tag present

Why it matters: Canonical tags tell search engines which version of a URL is the 'master' copy, preventing duplicate content penalties if your site is accessible via multiple parameters.

PASS seo.lang

Message: HTML lang is "en"

Why it matters: Without a lang attribute, screen readers cannot properly pronounce the text, and search engines struggle to geographically target your content.

PASS seo.alt

Message: All images have alt tags (or no images found)

Why it matters: Alt text is essential for visually impaired users relying on screen readers, and it helps search engines understand the context of your images for Image Search.

WARN seo.jsonld

Message: No JSON-LD structured data found

Why it matters: Structured data (JSON-LD) allows search engines to display rich snippets (like star ratings, recipes, or product prices) directly in the search results.

How to fix: Consider adding JSON-LD structured data to help search engines understand your content.

PASS seo.robotstxt

Message: robots.txt is present

Why it matters: A robots.txt file provides explicit crawling rules for search engine bots, ensuring they don't waste crawl budget on admin pages or private routes.

PASS seo.404

Message: Missing pages return 404

Why it matters: Soft 404s (returning a 200 OK for a page that doesn't exist) confuse search engines, wasting your crawl budget and getting garbage URLs indexed.

WARN seo.sitemap

Message: sitemap.xml is missing

Why it matters: An XML sitemap acts as a roadmap for search engines, helping them discover and index all your important pages quickly.

How to fix: Add a sitemap.xml file and submit it to Google Search Console.

PASS seo.links

Message: All 10 sampled links are reachable

Why it matters: Broken outbound or internal links create dead ends for users and search engine crawlers, severely damaging your SEO rankings and user experience.

SOCIAL (Score: 100%)

PASS social.og.title

Message: og:title is present

Evidence: `qwertyuii7 - Overview`

Why it matters: Open Graph titles dictate what your link looks like when shared on social platforms like iMessage, Slack, Facebook, and LinkedIn.

PASS social.og.image

Message: og:image is present

Evidence: `https://avatars.githubusercontent.com/u/189455750?v=4?s=400`

Why it matters: Without a valid, absolute Open Graph image URL, your shared links will just be plain text instead of a rich, clickable preview card.

PASS social.twitter

Message: Twitter card metadata is present

Evidence: `summary`

Why it matters: Twitter requires specific metadata tags to generate large preview cards. Without them, your tweets will just look like standard text links.

PASS social.favicon

Message: Favicon is reachable

Why it matters: Favicons establish your brand identity in browser tabs and bookmarks. A missing favicon makes your site look unfinished and generic.

PASS social.ogreach

Message: og:image is reachable

Why it matters: If your Open Graph image returns a 404, social platforms will fail to scrape it, resulting in a broken, empty preview card when your link is shared.

SECURITY (Score: 100%)

PASS sec.https

Message: Site uses HTTPS

Why it matters: HTTP traffic is unencrypted, exposing your users to man-in-the-middle attacks and causing browsers to mark your site as 'Not Secure'.

PASS sec.hsts

Message: HSTS header is present

Evidence: `max-age=31536000; includeSubdomains; preload`

Why it matters: HSTS forces browsers to always use HTTPS for your domain, protecting against downgrade attacks and cookie hijacking.

PASS sec.xcto

Message: X-Content-Type-Options is nosniff

Why it matters: Without nosniff, browsers might try to execute non-executable files (like images) as code, opening the door to cross-site scripting (XSS) attacks.

PASS sec.csp

Message: CSP header is present

Why it matters: A Content Security Policy is your strongest defense against XSS and data injection attacks by restricting where scripts and assets can load from.

PASS sec.frame

Message: Clickjacking protection is active

Why it matters: Without frame protection, malicious sites can embed your site in an invisible iframe to trick users into clicking buttons they didn't intend to (Clickjacking).

PASS **sec.referrer**

Message: Referrer-Policy is present

Why it matters: A loose Referrer-Policy can leak sensitive URLs and user data to third-party domains when users click external links.

PASS **sec.leak**

Message: No obvious tech stack leaks in headers

Why it matters: Exposing exactly what server, language, or framework you use makes it significantly easier for automated scanners to target known vulnerabilities in your stack.

PASS **sec.mixed**

Message: No mixed content detected

Why it matters: Loading insecure HTTP assets (like images or scripts) on a secure HTTPS page breaks the security guarantee, and modern browsers will block the active content entirely.

PASS **sec.cert**

Message: TLS Certificate is valid (70 days remaining)

Why it matters: An expired or invalid SSL certificate will cause browsers to completely block users from visiting your site with a massive, terrifying security warning.

PERF (Score: 62%)

PASS perf.compress

Message: Response is compressed

Evidence: gzip

Why it matters: Compression drastically reduces the file size of your HTML, CSS, and JS, meaning your site loads significantly faster for users on slow networks.

WARN perf.ttfb

Message: Moderate TTFB (764ms)

Evidence: 764ms

Why it matters: Time to First Byte measures your server's responsiveness. High TTFB means users stare at a blank screen longer before the page even begins to load.

 **How to fix:** Consider caching or CDN to improve server response time.

PASS perf.cache

Message: Cache-Control is present

Evidence: max-age=0, private, must-revalidate

Why it matters: Static assets without Cache-Control headers force repeat visitors to re-download unchanged files, wasting bandwidth and slowing down navigation.

WARN perf.html

Message: Large HTML document (237KB)

Evidence: 237KB

Why it matters: A massive HTML document is slow to download and expensive for browsers to parse, often indicating bloated server-side rendering or excessive inline CSS/JS.

 **How to fix:** Consider reducing inline CSS/JS or simplifying DOM to speed up parsing.

WARN perf.lazy

Message: 29 images missing loading="lazy"

Why it matters: Images below the fold without loading="lazy" are downloaded immediately, stealing bandwidth from critical assets that the user actually sees right now.

💡 **How to fix:** Add loading="lazy" to images below the fold to save bandwidth.

FAIL perf.blocking

Message: 1 render-blocking script(s) in <head>

Why it matters: Synchronous scripts in the <head> block the browser from rendering the page until they finish downloading and executing, causing a white-screen delay.

💡 **How to fix:** Add 'defer' or 'async' to <script> tags in the head to avoid blocking page render.

PASS perf.images

Message: All 10 sampled images are reachable

Why it matters: Broken images result in ugly missing-image icons, immediately breaking trust and making your site look unmaintained or broken.

MOBILE (Score: 100%)

PASS

mobile.viewport

Message: Viewport tag looks good

Evidence: `width=device-width`

Why it matters: Without a proper viewport tag, mobile devices will render your site as a zoomed-out desktop page, ruining the mobile user experience and hurting SEO.

RELIABILITY (Score: 100%)

PASS rel.www

Message: www.github.com correctly redirects to your primary domain

Why it matters: Serving your site on both www and non-www without a redirect splits your search engine ranking power (SEO equity) and creates duplicate content issues.
